Breast Cancer – Inflammatory (IBC)

Disclaimer: This algorithm has been developed for MD Anderson using a multidisciplinary approach considering circumstances particular to MD Anderson’s specific patient population, services and structure, and clinical information. This is not intended to replace the independent medical or professional judgment of physicians or other health care providers in the context of individual clinical circumstances to determine a patient’s care. This algorithm should not be used to treat pregnant women.

CLINICAL PRESENTATION

- Rapid onset ≤ 6 months of breast erythema and/or peau d’orange edema, and/or swollen breast, with or without an underlying palpable mass
- With or without nipple inversion
- Skin changes occupying at least one-third of the breast
- Breast swelling is often present
- Erythema may or may not be present

INITIAL EVALUATION

- History and physical
- Obtain bilateral breast photographs to establish baseline clinical appearance and follow up with medical photography for treatment response documentation
- Bilateral diagnostic mammography
- Bilateral breast and nodal ultrasound (include contralateral nodes even if negative contralateral breast)
- Bilateral breast MRI, if ultrasound and mammogram is not diagnostic
- Obtain ultrasound-guided core biopsy of tumor (MRI-guided biopsies if mass not present)○ Consider skin punch biopsy in addition to breast parenchymal biopsy
- Multidisciplinary evaluation

Pathology review:
- HER2 (human epidermal growth factor receptor) status
  ○ Germline BRCA testing for HER2 negative status
- ER, PR status
- Composite histologic grade
- Histologic type
- Lymphatic/vascular invasion

- CBC with differential, complete metabolic panel
- PET/CT scan - If PET/CT not possible, then CT chest/abdomen/pelvis with contrast and bone scan is acceptable. If cN3 or c disease is suspected (supraclavicular, infraclavicular), add CT neck to CT chest/abdomen/pelvis with contrast and bone scan.
- FNA or core biopsy of an index suspicious nodes, if not already performed
- Clip placement of positive axillary node (N1 disease, < 4 nodes) if required by surgery
- MRI brain if extracranial stage IV disease confirmed by PET/CT scan or if neurological symptoms (e.g., headache, visual changes, etc.)
- Consider Plastic Surgery consult
- Enroll in prospective lymphedema screening program
- Pre-operative lymphedema education
- Lifestyle risk assessment
- IBC education
- Enroll in IBC registry
- Consider need for genetic counseling, fertility preservation, and pregnancy testing
- Consider referral to body image therapist

FNA = fine needle aspiration
ER = estrogen receptor
PR = progesterone receptor
pCR = pathological complete response

1 Perform nodal biopsy on the node which would have maximum impact on nodal staging and treatment. If both axillary and supraclavicular nodes appear suspicious, perform biopsy on supraclavicular node only.
2 Skin punch not required. Consider MD Anderson approved breast biomarkers.
3 For extensive skin involvement, consult plastic surgery for evaluation to assist with chest wall closure or immediate lymphatic reconstruction
4 Consult Plastic Surgery for patients who are interested in having reconstructive surgery later and want to discuss plastic surgery prior to modified radical mastectomy
5 See Physical Activity, Nutrition, and Tobacco Cessation algorithms; ongoing reassessment of lifestyle risks should be a part of routine clinical practice
6 Contact the clinical trial coordinator of the IBC registry at MD Anderson

Note: Consider Clinical Trials as treatment options for eligible patients.
Breast Cancer – Inflammatory (IBC)

DISCLAIMER: This algorithm has been developed for MD Anderson using a multidisciplinary approach considering circumstances particular to MD Anderson’s specific patient population, services and structure, and clinical information. This is not intended to replace the independent medical or professional judgment of physicians or other health care providers in the context of individual clinical circumstances to determine a patient’s care. This algorithm should not be used to treat pregnant women.

STAGE

NEOADJUVANT THERAPY

TREATMENT

ADJUVANT THERAPY

● Breast surgery\(^2\),\(^3\) with non-skin sparing mastectomy and auxiliary lymph node dissection (ALND) without immediate or delayed immediate reconstruction
● No immediate contralateral prophylactic mastectomy
● Physical therapy (PT) for range of motion exercises starting post-op day 1

● Systemic therapy\(^6\),\(^7\)
● Clinical trials
● Consider radiation therapy without surgery
● Discuss GCC with patient or if clinically indicated, with SDM\(^7\)

● Systemic therapy\(^6\)
● Consider multimodal therapy including surgical resection
● Discuss GCC with patient or if clinically indicated, with SDM\(^7\)

● Operable? Yes

● Additional systemic therapy\(^6\) with or without radiation therapy\(^4\),\(^5\)
● Discuss Goal Concordant Care (GCC) with patient or if clinically indicated, with Surrogate Decision-Maker (SDM)\(^7\)

● Operable? Yes

● See Appendix A for neoadjuvant therapy
● Consider clinical trials

No

Does patient have life expectancy of > 6 months and can tolerate surgery and local radiation therapy?\(^2\)

Stage III

Multidisciplinary evaluation of response\(^1\)

Stage IV

(De novo)

Operable? Yes

Multidisciplinary evaluation of response

Operable? Yes

Adjuvant therapy, see Appendix C

Systemic therapy\(^6\)

Operable? No

Symptom management (supportive care), if patient is not responding/tolerating therapy

Additional systemic therapy\(^6\)
● Consider clinical trial(s)
● Consult Radiation Oncology for palliative radiation
● Discuss GCC with patient or if clinically indicated, with SDM\(^7\)

Note: Consider Clinical Trials as treatment options for eligible patients.

Borderline resectable cases should be monitored closely and proceed to surgery if the tumor is progressing or the window for surgery and radiation therapy will be lost

For extensive skin involvement, ensure that all grossly abnormal skin is resected. Plastic surgery assistance may be required with chest wall closure or immediate lymphatic reconstruction.

Breast surgery is performed 4-6 weeks after neoadjuvant therapy

1 Borderline resectable cases should be monitored closely and proceed to surgery if the tumor is progressing or the window for surgery and radiation therapy will be lost.

2 For extensive skin involvement, ensure that all grossly abnormal skin is resected. Plastic surgery assistance may be required with chest wall closure or immediate lymphatic reconstruction.

3 Breast surgery is performed 4-6 weeks after neoadjuvant therapy.

4 Evaluate breast and nodes for response to therapy:

   ● Minimal residual disease or pathologic complete response, age > 45 years and negative margins: Once daily radiation of 50 Gy (2 Gy/fraction)
   ● Significant residual disease, age ≤ 45 years or close or positive margins: Twice daily radiation of 51 Gy (1.5 Gy/fraction)
   ● Boost: Radiation to chest wall and involved undissected upfront regional nodes with 16 Gy daily or 15 Gy twice daily

5 See Appendix B: Principles of Radiation Therapy

6 See Appendix D: Refractory, Recurrent or Metastatic Breast Cancer Systemic Therapy Treatment Options

7 GCC should be initiated by the Primary Oncologist. If Primary Oncologist is unavailable, Primary Team/Attending Physician to initiate GCC discussion and notify Primary Oncologist. Patients or if clinically indicated, the SDM should be informed of therapeutic and/or palliative options. GCC discussion should be consistent, timely, and re-evaluated as clinically indicated. The Advance Care Planning (ACP) note should be used to document GCC discussion. Refer to Goal Concordant Care home page (for internal use only).

Approved by the Executive Committee of the Medical Staff on 07/19/2022
Breast Cancer – Inflammatory (IBC)

SURVEILLANCE

- Physical exam at least every 3 months for 2 years, every 6 months for 3 years, then annually
- Annual gynecologic exam, if receiving tamoxifen
- Imaging is guided based on patient complaints and physical examination findings
- Assess bone health (see Survivorship – Breast Cancer: Bone Health algorithm)
- Encourage age appropriate cancer and general health guidelines
- Enroll in prospective lymphedema screening program, if not already enrolled
- Lymphedema management as needed. If a compression sleeve is prescribed, then change at least every 6 months.
- Referral to Physical Therapy for improving range of motion
- Consider referral to Physical Medicine and Rehabilitation for botox injections for radiation induced restricted range of motion unrelieved by physical therapy
- Consider referral to Plastic Surgery for autologous fat grafting to reduce radiation related fibrosis, delayed breast reconstruction, or for lymphedema surgery

See Page 4 for evaluation of local recurrence

Note: Consider Clinical Trials as treatment options for eligible patients.
EVALUATION FOR LOCAL RECURRENCE

Ipsilateral breast/chest wall recurrence or ipsilateral regional nodal recurrence with oligometastases or without diffuse metastases

- Biopsy to confirm recurrence with:
  - If intact breast, bilateral diagnostic mammogram
  - Ultrasound of bilateral breasts including regional nodal basins
  - Body imaging for distant recurrence
  - Biomarkers of breast/chest wall recurrence or nodal recurrence (if no breast/chest wall recurrence)

- Early evaluation by multidisciplinary team
- Preoperative systemic therapy

TREATMENT FOR RECURRENCE

- Modified radical mastectomy
- Refer to Principles of Radiation Therapy (see Appendix B)
- Consider Radiation Oncology consult

- Modified radical mastectomy with or without ALND and Radiation Oncology consult

- Consider neoadjuvant therapy
- Wide local excision (WLE) with margin assessment

- Consider systemic therapy
- Refer to Principles of Radiation Therapy (see Appendix B)
- Consider Radiation Oncology consult

- Consider systemic therapy
- Radiation Oncology consult
- Discuss GCC with patient or if clinically indicated, with SDM

- Consider systemic therapy
- Chemotherapy

- Consider additional systemic therapy

- Radiation therapy to chest wall and regional lymphatics, if no previous radiation
- Discuss GCC with patient or if clinically indicated, with SDM

- Surveillance and endocrine therapy if hormone receptor positive
- Consider chemotherapy
- Discuss GCC with patient or if clinically indicated, with SDM

- Persistent disease?

1 Consider clinical trial for diffuse metastasis
2 Consider MD Anderson approved breast biomarkers
3 See Appendix A: Neoadjuvant Chemotherapy Options
4 See Appendix C: Adjuvant Chemotherapy Options
5 Surveillance upon completion of all therapy, see Page 3
6 GCC should be initiated by the Primary Oncologist. If Primary Oncologist is unavailable, Primary Team/Attending Physician to initiate GCC discussion and notify Primary Oncologist. Patients or if clinically indicated, the SDM should be informed of therapeutic and/or palliative options. GCC discussion should be consistent, timely, and re-evaluated as clinically indicated.
7 The ACP note should be used to document GCC discussion. Refer to Goal Concordant Care home page (for internal use only).
8 See Appendix D: Refractory, Recurrent or Metastatic Breast Cancer Systemic Therapy Treatment Options
APPENDIX A: Neoadjuvant Systemic Therapy Options

</tr>
</tbody>
</table>

1 Refer to NCCN Guidelines for specific doses and number of cycles
AC = doxorubicin and cyclophosphamide
TCHP = docetaxel, carboplatin, trastuzumab, pertuzumab
THP = docetaxel, trastuzumab, pertuzumab
TNBC = triple negative breast cancer

Disclaimer: This algorithm has been developed for MD Anderson using a multidisciplinary approach considering circumstances particular to MD Anderson’s specific patient population, services and structure, and clinical information. This is not intended to replace the independent medical or professional judgment of physicians or other health care providers in the context of individual clinical circumstances to determine a patient’s care. This algorithm should not be used to treat pregnant women.
APPENDIX B: Principles of Radiation Therapy

- Post-operative radiation therapy should be administered within 4 weeks after breast surgery when feasible
- Radiation therapy should be completed before adjuvant therapy
- All initially involved skin plus 3 cm margin should be included in radiation fields (refer to pre-chemotherapy photos, if available)
- Drain sites should be included in primary fields
- Care must be taken to review the scar extent and ensure the medial field provides 3 cm of dosimetric cover beyond the scar even if this involves treating the opposite breast
- The chest wall, internal mammary chain (IMC) nodes in intercostal spaces 1-3 and undissected axillary apex/supraclavicular fossa are mandatory targets even if not grossly involved
- Initial cross sectional imaging must be reviewed and regional nodes transferred onto the planning scan to be targeted for boost planning
- In photon/electron plans junctions between fields are overlapped 3 mm to ensure skin is not underdosed
- Minimal IMC and regional nodal target coverage 90%
- Commonly used radiation regimens:
  - Age > 45 years and pCR: 50 Gy in 25 fractions to chest wall, infraclavicular, supraclavicular and IMC, 10 Gy/5 fx boost to chest wall and any N3 undissected nodal sites
  - Age ≤ 45 years or no pCR: 51 Gy twice daily to chest wall, infraclavicular, supraclavicular and IMC, 15 Gy/5 fx twice daily boost to chest wall and any N3 undissected nodal sites
- When boosting the infraclavicular or supraclavicular fossa in 3D plans, a composite is required during initial planning to ensure brachial plexus constraints are not exceeded
- Chest wall boosts should cover the surgical flaps (larger than a scar boost)

Principles of re-irradiation:
- Requires careful review of prior radiation therapy records
- Should be discouraged if prior radiation within 2 years
- Should be discouraged if definitive dose can not be safely delivered
## APPENDIX C: Adjuvant Systemic Therapy Options

<table>
<thead>
<tr>
<th>Molecular Subtypes</th>
<th>First Line Therapy</th>
<th>Considerations</th>
</tr>
</thead>
</table>
| **TNBC**<sup>2</sup> | - No residual disease (pCR)  
  ○ BRCA negative or BRCA positive: Pembrolizumab 200 mg IV every 3 weeks for 9 cycles  
  ○ Residual disease (non-pCR)  
    ○ BRCA negative: Concurrent pembrolizumab and capecitabine; if pembro contraindicated, capecitabine alone  
    ○ BRCA positive: Olaparib 300 mg PO twice daily for 1 year or sequential olaparib followed by pembrolizumab | N/A |
| **ER+** | - No residual disease (pCR), BRCA negative or BRCA positive  
  ○ Premenopausal<sup>3</sup> at diagnosis  
    - OFS plus AI<sup>4</sup> for 10 years  
    - Tamoxifen for 10 years only if OFS and AI<sup>4</sup> not feasible  
  ○ Postmenopausal at diagnosis  
    - AI<sup>4</sup> for 10 years  
    - Tamoxifen for 10 years only if AI<sup>4</sup> not feasible  
  ○ Residual disease (non-pCR)  
    ○ BRCA negative: Endocrine therapy as above plus abemaciclib 150 mg PO twice daily for 2 years  
    ○ BRCA positive: Endocrine therapy as above plus olaparib. Consider abemaciclib after olaparib completed. | - Premenopausal  
  ○ Consider OFS plus tamoxifen for patients who cannot tolerate AI  
  - Postmenopausal  
  ○ Consider adjuvant bisphosphonate |
| **HER2**<sup>+</sup> | - No residual disease (pCR): Trastuzumab plus pertuzumab for 1 year  
  - Residual disease (non-pCR): Adjuvant T-DM1 for 1 year | - For residual disease (non-pCR), recommend neratinib for 1 year after completion of T-DM1  
  - For no residual disease (pCR), recommend discussion about neratinib for 1 year |

---

**Notes:**
- Longer durations of endocrine therapy (AI and tamoxifen) for > 5 years provide larger absolute benefit for higher risk cases (e.g., node-positive, or stage III).
- Bone density should be monitored in postmenopausal patients, consider antiresorptive therapy for osteopenia and institute for osteoporosis. Calcium/vitamin D replacement is recommended for all patients.
- Consider clinical trials in all tumor subtypes.
- AI = aromatase inhibitor  
  OFS = ovarian function suppression  
  pCR = pathological complete response  
  T-DM1 = ado-trastuzumab emtansine  
  TNBC = triple negative breast cancer

---

**1 Consider clinical trials in all tumor subtypes**
**2 For patients with pCR, see Page 3 for surveillance**
**3 Male patients should be treated similarly to premenopausal patients. Use of aromatase inhibitors or fulvestrant should be accompanied by androgen deprivation therapy (medical/surgical).**
**4 Aromatase inhibitors should only be used in patients who are clearly postmenopausal (status post surgical bilateral oophorectomy (BSO), clinically suppressed on gonadotropin analogues, > 2 years without clinical menses if stopped early due to chemotherapy, or naturally ceased menses for 1 year; for patients after hysterectomy or < 55 years old, consider verifying with estrogen, luteinizing hormone (LH) and follicle stimulating hormone (FSH) levels. If definitive BSO with hysterectomy, verification with hormone levels is not indicated. Aromatase inhibitors may not be an option if the patient is intolerant, concerns over bone density or patient declines therapy.**

<td>EC (epirubicin and cyclophosphamide)</td>
<td>Gemcitabine and paclitaxel</td>
<td>Ixabepilone/capecitabine</td>
</tr>
</tbody>
</table>

### First-line regimens for HER2-positive disease:

- Pertuzumab plus trastuzumab and docetaxel
- Pertuzumab plus trastuzumab and paclitaxel
- T-DM1 (ado-trastuzumab emtansine)
- Trastuzumab with vinorelbine
- Trastuzumab with capecitabine
- Fam-trastuzumab deruxtecan-nxki
- Margetuximab-empk

### HER2-Related Therapies

<table>
<thead>
<tr>
<th>Endocrine based therapies:</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Fulvestrant</td>
</tr>
<tr>
<td>o Fulvestrant with or without CDK 4/6 inhibitor (abemaciclib, palbociclib, or ribociclib)</td>
</tr>
<tr>
<td>o Fulvestrant with alpelisib</td>
</tr>
<tr>
<td>o Fulvestrant with AI</td>
</tr>
<tr>
<td>• Abemaciclib single agent</td>
</tr>
<tr>
<td>• Megestrol acetate</td>
</tr>
<tr>
<td>• Estrogen (estradiol)</td>
</tr>
<tr>
<td>• Danazol</td>
</tr>
</tbody>
</table>

### Endocrine Based Therapies

- Aromatase inhibitors (AI)
  - Anastrozole
  - Letrozole
  - Exemestane
  - AI with or without CDK 4/6 inhibitor (abemaciclib, palbociclib, or ribociclib)
  - Exemestane plus everolimus
- Tamoxifen

### BRCA-positive directed therapies: Olaparib or talazoparib

### Triple Negative Breast Cancer with PD-L1 expression: Pembroliuzumab plus chemotherapy (gemcitabine with carboplatin or albumin bound paclitaxel)

1 After maximal benefit achieved with chemotherapy, consider continuous anti-HER2 therapy alone or pertuzumab plus trastuzumab, if ER or PR positive, in combination with appropriate hormonal therapy.

(does not apply to T-DM1 or fam-trastuzumab deruxtecan-nxki)
PRINCIPLES OF INFLAMMATORY BREAST ONCOLOGIC SURGERY

Multidisciplinary management of invasive breast cancer
- Surgical management of breast cancer is an important aspect of curative intent therapy. Surgical decision-making is imbedded within the context of the multidisciplinary management of the breast oncology patient (both male and female).
- Patient participation in clinical trials when appropriate is strongly encouraged
- Breast surgery is performed 4-6 weeks after neoadjuvant chemotherapy
- Post-operative radiation therapy is administered 4 weeks after surgery

Diagnosis of breast malignancy
- Dedicated breast imaging at presentation should include bilateral diagnostic mammograms and bilateral breast/nodal basin ultrasound to evaluate extent of disease
- Core needle biopsy is the preferred method of diagnosis of a palpable breast mass or a non-palpable breast imaging abnormality. Pathology should include biomarker assessment.
- FNA biopsy can be used for additional suspicious lesions in the ipsilateral breast to evaluate for multifocal/multi-centric disease and for diagnosis of metastases in suspicious regional nodes
- Placement of radiopaque clip marker with confirmation by imaging should be performed after needle biopsy
- Medical photography should be utilized in patients who present with skin changes
- Punch biopsy of the skin should be considered to document skin involvement

Surgical management
- Modified radical mastectomy (MRM) is standard of care in patients with IBC. Immediate breast reconstruction is contraindicated. Contralateral prophylactic surgery is not recommended.
- Referral to plastic surgery for delayed reconstruction and for possible lymphedema intervention is recommended
- Psychosocial and body image concerns should be addressed prior to surgery

Surgical staging of the axilla
Axillary ultrasound and physical examination are recommended for clinical axillary staging in invasive breast cancer. Biopsy of suspicious axillary node(s) and placement of radiopaque clip marker if positive for metastasis is recommended.

Management of biopsy proven axillary disease
- ALND (level I and II) is indicated in patients with biopsy proven clinically node positive disease and pathologic positive nodal involvement. Level III dissection may be considered in patients with level III residual disease after neoadjuvant chemotherapy.
- Evaluation by a physical therapist for improved range of motion and screening for lymphedema is recommended

Continued on next page
Neoadjuvant systemic therapy
- Neoadjuvant systemic therapy is standard of care in patients with IBC
- Extent of disease in the breast and regional nodes should be determined and documented prior to initiation of neoadjuvant systemic therapy

Management of local-regional recurrence
- Breast imaging including mammograms (if recurrence after breast conserving surgery), breast/chest wall and bilateral nodal basin ultrasound and MRI when appropriate should be obtained
- Diagnosis by core needle biopsy including biomarker evaluation is recommended
- Staging should be performed to evaluate for distant metastatic disease, and PET-CT is preferred to understand the extent of lymph node involvement
- Multimodality therapy is recommended including systemic neoadjuvant therapy, and surgical resection followed by systemic adjuvant therapy and radiation therapy

Stage IV disease
- For patients who have a life expectancy of > 6 months and can tolerate systemic therapy and local radiation therapy, consider multimodal therapy including surgical resection
- In selected patients with oligometastatic disease, excellent response to systemic therapy and acceptable performance status, surgery of the primary tumor and nodal involvement may be considered to achieve no evidence of disease (NED) status. Definitive management of the oligometastatic disease is also recommended.
- If localized stage IV to the contralateral axilla, consider contralateral ALND followed by radiation therapy

Special considerations
Palliative mastectomy may be considered in patients with advanced local progression, with symptomatic fungating, and with bleeding tumors not responsive to systemic therapy
**Disclaimer:** This algorithm has been developed for MD Anderson using a multidisciplinary approach considering circumstances particular to MD Anderson’s specific patient population, services and structure, and clinical information. Breast Cancer – Inflammatory (IBC)

Disclaimer: This algorithm has been developed for MD Anderson using a multidisciplinary approach considering circumstances particular to MD Anderson’s specific patient population, services and structure, and clinical information. This is not intended to replace the independent medical or professional judgment of physicians or other health care providers in the context of individual clinical circumstances to determine a patient’s care. This algorithm should not be used to treat pregnant women.

DEVELOPMENT CREDITS

This practice algorithm is based on majority expert opinion of the Inflammatory Breast Cancer Clinical providers at the University of Texas MD Anderson Cancer Center. It was developed using a multidisciplinary approach that included input from the following:

Core Development Team Leads
Anthony Lucci, MD (Breast Surgical Oncology)
Naoto Ueno, MD, PhD (Breast Medical Oncology)
Wendy Woodward, MD, PhD (Radiation Oncology)

Workgroup Members

| Angela Alexander, PhD (Breast Medical Oncology) | Angela Marx, BSN, RN (Breast Medical Oncology) |
| Edward Chang, MD (Plastic Surgery) | Valerie Reed, MD (Radiation Oncology) |
| Vivian Chiv, MSN, RN (Breast Medical Oncology) | Sadia Saleem, MD (Breast Medical Oncology) |
| Sarah DeSnyder, MD (Breast Surgical Oncology) | Mark Schaverien, MD (Plastic Surgery) |
| Elizabeth FitzSullivan, MD (Breast Surgical Oncology) | Michael Stauder, MD (Radiation Oncology) |
| Wendy Garcia, BS | Susie Sun, MD (Breast Surgical Oncology) |
| Yun Gong, MD (Pathology) | Mediget Teshome, MD (Breast Surgical Oncology) |
| Lei Huo, MD, PhD (Pathology) | Vicente Valero, MD (Breast Medical Oncology) |
| Savitri Krishnamurthy, MD (Pathology) | Mary Lou Warren, DNP, APRN, CNS-CC* |
| Rachel Layman, MD (Breast Medical Oncology) | Gary Whitman, MD (Breast Imaging) |
| Huong Le-Petross, MD (Breast Imaging) | Jie Willey, MSN, RN (Breast Medical Oncology) |
| Jonathan Malara, PharmD (Pharmacy Clinical Programs) | |
