**INITIAL EVALUATION**

Patient anticipated to receive IEC cell therapy

See Appendix A for Supportive Care and Appendices B and C for Infectious Disease Screening and Prophylaxis Considerations

Patient received IEC cell therapy

Monitoring of patient after cell infusion per protocol to include:
- Vital signs
- Neurological status
- History
- Physical exam
- Lab results
- As clinically indicated: cardiac monitoring, EKG, ECHO and chest x-ray

**MANAGEMENT**

Does patient have either?

- Yes
  - See Appendix H for Management of CRS
  - See Appendix I for Management of ICANS
- No

**Fever** (oral temperature ≥ 38°C)

**Hypotension** defined as:
- Age 1-10 years: SBP < [70 + (2 x age in years)] mmHg
- Age ≥ 10 years: SBP < 90 mmHg

**Monitoring of patient after cell infusion per protocol to include:**
- Vital signs
- Neurological status
- History
- Physical exam
- Lab results
- As clinically indicated: cardiac monitoring, EKG, ECHO and chest x-ray

**Does patient have either?**

- Yes
  - See Appendix H for Management of CRS
  - See Appendix I for Management of ICANS
- No

**See Appendix D for Grading of CRS**

1. If the subject has fever with or without hypotension or hypoxia within the first 4 weeks of engineered immune effector cell (IEC) therapy, the subject may have CRS if the symptoms or signs are not attributable to any other cause:
   - Fever should be present at onset of CRS (oral temperature ≥ 38°C)
   - Hypotension (requiring IV fluids or vasopressors to maintain normal blood pressure) defined as:
     - Age 1-10 years: SBP < [70 + (2 x age in years)] mmHg
     - Age ≥ 10 years: SBP < 90 mmHg
   - Hypoxia (requiring supplemental oxygen to correct a deficit in oxygenation)

2. If the subject has any of the following within the first 8 weeks of engineered IEC-therapy, the subject may have ICANS if the symptoms or signs are not attributable to any other cause:
   - IEC-Associated Encephalopathy (ICE) Score of < 10 (Appendix F)
   - Depressed level of consciousness
   - Convulsive or non-convulsive seizures (can be focal or generalized)
   - Motor weakness (can be focal motor weakness, hemiparesis, paraparesis)
   - Focal / diffuse cerebral edema on imaging or signs of raised intracranial pressure including decerebrate or decorticating posturing, cranial nerve VI palsy, papilledema, or Cushing's triad

3. See Appendix D for Grading of CRS

4. See Appendix E for Grading of ICANS

Disclaimer: This algorithm has been developed for MD Anderson using a multidisciplinary approach considering circumstances particular to MD Anderson’s specific patient population, services and structure, and clinical information. This is not intended to replace the independent medical or professional judgment of physicians or other health care providers in the context of individual clinical circumstances to determine a patient’s care. This algorithm should not be used to treat pregnant women.
Before and During IEC Infusion

- Imaging of the brain prior to IEC infusion (preferably MRI with and without contrast but CT without contrast is acceptable if MRI cannot be performed) to rule out any central nervous system disease and also to serve as a baseline for comparison in case the patient develops ICANS
  - For patients with a known history of seizures, migraines, and/or other CNS disorders including malignant disease, consider Neurology consult prior to IEC infusion
- IEC infusion may be administered either in the ambulatory unit or in the inpatient unit
- If the median time to onset of CRS is expected to be < 48 hours, hospitalization should be considered for IEC infusion
- When hospitalized, admission to an IEC-designated unit with capability for cardiac monitoring by telemetry is recommended
- Tumor lysis precautions for patients with high tumor burden, as per standard guidelines
- Seizure prophylaxis with levetiracetam 10 mg/kg (maximum 500 mg) PO or IV every 12 hours for 30 days, starting on the day of infusion for IEC therapies associated with a high incidence of ICANS, in patients with a history of seizures or brain metastases
- Consider filgrastim products if the patient is neutropenic and concern for infection (if not already receiving)
- Ensure appropriate documentation in EHR regarding IEC therapy and “conditional” corticosteroid contraindication

APPENDIX A: Checklist / Supportive Care Considerations for Managing Patients Receiving IEC Therapy

IEC Therapy Toxicity Assessment and Management (also known as CARTOX) – Pediatric

Disclaimer: This algorithm has been developed for MD Anderson using a multidisciplinary approach considering circumstances particular to MD Anderson’s specific patient population, services and structure, and clinical information. This is not intended to replace the independent medical or professional judgment of physicians or other health care providers in the context of individual clinical circumstances to determine a patient’s care. This algorithm should not be used to treat pregnant women.
For Inpatients:

**Patient Monitoring After IEC infusion during Inpatient Admission**

- Assess vital signs every 4 hours (inpatient encounter)
- Strict monitoring of oral and IV fluid input and output (including urine and stool)
- Daily measurement of body weight
- Daily review of patient history and physical examination
- Daily complete blood count with differential and complete metabolic profile
- Coagulation profile at least twice weekly or more frequently if clinically indicated
- Consider monitoring C-reactive protein (CRP) and ferritin levels daily during the phase when CRS is likely to occur and continue to monitor until CRS and/or ICANS resolves (if present).
- Monitor as needed thereafter.
- Consider cytokine panel if clinically indicated
- Assessment and grading of CRS (document in CARTOX flowsheet) should be completed at least every 12 hours and whenever there is a change in patient’s status. If a change in status occurs, monitor for CRS every 6 hours or more frequently as indicated.
- Assessment and grading for ICANS (document in CARTOX flowsheet) should be completed at least every 12 hours including the CAPD (if age or developmental age is ≤ 18 years of age) and 10-point ICE score if ≥ 12 years of age. If < 12 years of age, the CAPD should be utilized. Any increase in CAPD score requires monitoring every 6 hours or more frequently as indicated.
- Maintenance IV fluids with normal saline to ensure adequate hydration
- Cardiac monitoring by telemetry is recommended for ≥ Grade 1 CRS and continued until CRS resolves
- For post-IEC infusion headache that is unresponsive to analgesics, consider brain imaging and lumbar puncture
- Neurology consult recommended for patients who develop Grade 1 or higher ICANS
- Critical Care and/or MERIT team will follow patients on an as-needed basis
- Infectious Diseases team will follow patients on an as-needed basis
  - Consult should be performed early for patients with positive infectious disease screening or for persistent fevers
Notifications and contingency orders during Inpatient Admission

• Notify SCT physician on detection of any of the following:

  The baseline blood pressure should be considered to determine monitoring parameters and verified with the physician prior to admission

  • Hypotension defined as:
    - Age 1-10 years: SBP < [70 + (2 x age in years)] mmHg
    - Age >10 years: SBP < 90 mmHg
  • Heart rate based on age or arrhythmia:
    - Age 1-2 years: > 130 or < 75 beats per minute
    - Age 3-6 years: > 120 or < 70 beats per minute
    - Age > 6 years: > 110 or < 65 beats per minute
  • Respiratory rate based on age:
    - Age 1-2 years: > 40 or < 24 breaths per minute
    - Age 3-6 years: > 34 or < 22 breaths per minute
    - Age > 6 years: > 30 or < 18 breaths per minute
  • Oxygen saturation < 94% on room air
  • Decreased urine output (<0.5 mL/kg/hour)
  • Upward trends in creatinine or liver function tests
  • Tremors or jerky movements in extremities
  • Change in mental status (alertness, orientation, speech, ability to write a sentence, or ICE score of < 10 and/or CAPD score > 7)
  • For oral temperature ≥ 38°C, send blood cultures (central and peripheral) and urine for urinalysis and culture, obtain portable chest x-ray, and notify physician

• For patients with neutropenia and fever, start empiric broad-spectrum antibiotics
• Do not administer corticosteroids unless approved by physician
• If patient develops ICANS, withhold oral intake of food, fluids, and medicines, and notify physician
• PRN medications
  • Acetaminophen (1st choice) or ibuprofen (2nd choice, if not contraindicated) for fever ≥ 38°C
  • Cooling blanket for fever ≥ 38.3°C
  • Normal saline 10 - 20 mL/kg (maximum 1,000 mL) bolus prn for hypotension; may repeat once if patient remains hypotensive after 1st bolus
  • Transfuse packed red blood cells (PRBC) to maintain hemoglobin > 8 gm/dL
  • Transfuse platelets to maintain > 20 K/microliter; for patients with abnormal brain imaging transfuse platelets to maintain > 50 K/microliter
  • PRN tocilizumab to be activated only on physician order (“ok to give tocilizumab” order should be placed if dose approved by physician)
**APPENDIX B: Infectious Disease Screening (within 30 days prior to apheresis is recommended)**

**Required Infectious Disease Screening**
- Hepatitis B surface antigen (HBsAg)
- Anti-hepatitis B core antibody (HBcAb)
- Anti-hepatitis C virus antibody (HCVAb)
- Anti-human immunodeficiency virus (HIV) antibody (HIV type 1 / 2 type O Ab)
- HIV-1 / HCV / HBV Nucleic Acid Test

**Optional Infectious Disease Screening (as clinically indicated)**
- Anti-human T-cell lymphotrophic virus (HTLV) antibody (HTLV I/II Ab)
- Rapid Plasma Reagin (RPR) – syphilis
- Cytomegalovirus (CMV) IgG and IgM
- West Nile Virus nucleic acid test
- T Cruzi antibody
- Strongyloides antibody to assess for previous infection or exposure
- T-spot to assess for exposure or history of tuberculosis

---

1 Primary team should follow up on all testing and order follow up testing and consults as indicated prior to proceeding to IEC therapy

2 Patients with recent travel out of the country should be considered for some/all of these additional tests
## APPENDIX C: Infection Prophylaxis Considerations for IEC Therapy

Most patients who receive immune effector cells receive a fludarabine-based chemotheraphy regimen prior to IEC infusion. Fludarabine causes immunosuppression and can increase the risk of opportunistic infections. Additionally, patients who receive IEC therapies targeting B-cells are at increased risk of infection due to B-cell aplasia.

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

¹ Adjust for renal function
² Loading dose of antifungals is not needed if it is being used for prophylaxis
³ Posaconazole prophylaxis is recommended for HIGH RISK patients with leukemia, recent allogenic stem cell transplant, prior history of mold infection, neutropenia lasting ≥ 14 days, Grade 3 or 4 CRS/ICANS, those who receive ≥ 3 days of corticosteroids, or those who develop hemophagocytic lymphohistiocytosis (HLH) (see Appendix N). If corticosteroids are given, continue posaconazole for at least 1 month AFTER COMPLETION of corticosteroids. Do not stop posaconazole or voriconazole prophylaxis if ANC < 1 K/microliter. Isavuconazole may be used if the patient had previously been taking it or if posaconazole is not covered by insurance. In the event posaconazole, voriconazole, or an echinocandin are contraindicated or pose affordability/access issues, then use fluconazole for prophylaxis and consider aspergillus antigen testing at least once a week DURING corticosteroids and for at least a month AFTER completion of corticosteroids. Patients not meeting high risk definitions will be considered to be at LOW RISK for fungal infections and receive prophylaxis as detailed above.

Continued on next page
Routine CMV prophylaxis is not required but CMV monitoring by PCR is recommended 1-2 times a week if neutropenia lasts ≥14 days, if patient experiences Grade 3 or 4 CRS/ICANS, or if patient develops hemophagocytic lymphohistiocytosis (HLH). CMV monitoring is recommended for at least 30 days after completion of corticosteroids.

See Appendix N for Diagnostic Criteria for IEC-associated Fulminant Hemophagocytic Lymphohistiocytosis (HLH) or Macrophage Activation Syndrome (MAS).

</tr>
</tbody>
</table>

CPAP = continuous positive airway pressure  
BiPAP = bilevel positive airway pressure  

¹ Organ toxicities associated with CRS may be graded according to CTCAE v5.0 but they do not influence CRS grading.  
² Fever is defined as temperature ≥ 38°C not attributable to any other cause. In patients who have CRS then receive antipyretics or anti-cytokine therapy such as tocilizumab or corticosteroids, fever is no longer required to grade subsequent CRS severity. In this case, CRS grading is driven by hypotension and/or hypoxia.  
³ CRS grade is determined by the more severe event hypotension or hypoxia not attributable to any other cause. For example, a patient with temperature of 39.5°C, hypotension requiring one vasopressor and hypoxia requiring low-flow nasal cannula is classified as having Grade 3 CRS.  
⁴ Low-flow nasal cannula is defined as oxygen (O₂) delivered at ≤ 5 liters/minute. Low flow also includes blow-by oxygen delivery, sometimes used in pediatrics. High-flow nasal cannula is defined as oxygen delivered at > 5 liters/minute.

</tr>
</tbody>
</table>

CAPD = Cornell Assessment of Pediatric Delirium  
EEG = electroencephalogram

1. ICANS grade is determined by the most severe event (CAPD and/or ICE score, level of consciousness, seizure, motor findings, raised intracranial pressure/cerebral edema) not attributable to any other cause. For example, a patient with a ICE score of 3 who has a generalized seizure is classified as having Grade 3 ICANS.
2. See Appendix F for Immune Effector Cell–associated Encephalopathy (ICE) Score for patients ≥ 12 years of age.
3. A patient with an ICE score of 0 may be classified as having Grade 3 ICANS if the patient is awake with global aphasia or Grade 4 ICANS if the patient is unarousable.
4. CAPD is intended for patients on Pediatric Service who are ≤ 12 years of age and/or for children > 12 years of age for whom this is developmentally appropriate (see Appendix G).
5. Depressed level of consciousness should not be attributable to any other cause (e.g., sedating medication).
6. Tremors and myoclonus associated with immune effector cell therapies may be graded according to CTCAE v5.0 but they do not influence ICANS grading.
7. Ophthalmology may be consulted to assess for papilledema if concern for elevated ICP, but otherwise not needed for all patients.
8. Intracranial hemorrhage with or without associated edema is not considered a neurotoxicity feature and is excluded from ICANS grading. It may be graded according to CTCAE v5.0.
### APPENDIX F: Immune Effector Cell-associated Encephalopathy (ICE) Score - for patients ≥ 12 years of age

- **Orientation**: Orientation to year, month, city, hospital: 4 points (1 point each)
- **Naming**: Name 3 objects (e.g., clock, pen, button): 3 points (1 point each)
- **Following commands**: (e.g., Show me 2 fingers or close your eyes and stick out your tongue): 1 point
- **Writing**: Ability to write a standard sentence (e.g., Our national bird is the bald eagle): 1 point
- **Attention**: Count backwards from 100 by 10: 1 point

Score 10: No impairment
Score 7-9: Grade 1 ICANS
Score 3-6: Grade 2 ICANS
Score 0-2: Grade 3² ICANS
Score 0 due to patient unarousable and unable to perform ICE assessment: Grade 4 ICANS

¹ A patient with an ICE score of 0 may be classified as having Grade 3 ICANS if the patient is awake with global aphasia or may be classified as having Grade 4 ICANS if the patient is unarousable.
**APPENDIX G: Cornell Assessment of Pediatric Delirium (CAPD)**

(score for children ≤ 12 years of age and/or for children > 12 years of age for whom this is developmentally appropriate)

1 An increasing CAPD score (even if less than 9) may indicate concern for delirium and warrants more frequent monitoring.

2 Richmond Agitation Sedation Scale (RASS):
- +4 Combative - Overly combative, violent, immediate danger to staff
- +3 Very Agitated – Pulls or removes tube(s) or catheter(s); aggressive
- +2 Agitated – Frequent non-purposeful movement, fights ventilator
- +1 Restless – Anxious, but movements not aggressive or vigorous
- 0 Alert and Calm
- -1 Drowsy – Not fully alert, but has sustained awakening (eye-opening/eye contact) to voice (≥ 10 seconds)
- -2 Light sedation – Briefly awakens with eye contact to voice (< 10 seconds)
- -3 Moderate sedation – Movement
- -4 Deep sedation – No response to voice, but movement or eye opening to physical stimulation
- -5 Unarousable

3 For patients age 1-2 years, the following serve as guidelines to the corresponding questions (1-8):
2. Reaches and manipulates objects, tries to change position, if mobile may try to get up
3. Prefers primary parent, upset when separated from preferred caregivers. Comforted by familiar objects (i.e., blanket or stuffed animal)
4. Uses single words or signs
5. No sustained calm state
6. Not soothed by usual comforting actions, for example, singing, holding, talking, and reading
7. Little if any play, efforts to sit up, pull up, and if mobile crawl or walk around
8. Not following simple directions. If verbal, not engaging in simple dialogue with words or jargon

**APPENDIX H: Management of CRS**

<table>
<thead>
<tr>
<th>CRS Grade</th>
<th>CRS Parameter</th>
<th>Diagnostic Work-Up</th>
<th>Supportive Care</th>
<th>Anti-IEC Therapies</th>
</tr>
</thead>
<tbody>
<tr>
<td>Grade 1</td>
<td>Fever</td>
<td>• Assess for infection with blood and urine cultures, and chest radiography. Cardiac telemetry and pulse oximetry.</td>
<td>• Acetaminophen and hypothermia blanket as needed for the treatment of fever. Ibuprofen if fever is not controlled with above; use with caution or avoid with thrombocytopenia or renal dysfunction. Empiric broad-spectrum antibiotics and consider filgrastim products if neutropenic. Maintenance IV fluids for hydration. Symptomatic management of constitutional symptoms and organ toxicities as per standard guidelines. If not on seizure prophylaxis, initiate levetiracetam 10 mg/kg (maximum 500 mg) PO or IV twice daily.</td>
<td>Consider tocilizumab(^2) for 1 dose for persistent fever lasting greater than 3 days.</td>
</tr>
<tr>
<td>Grade 2</td>
<td>Hypotension(^2)</td>
<td>• Cardiac telemetry. Fever work-up if not previously performed. ○ Assess for infection with blood and urine cultures, and chest radiography.</td>
<td>• Consider transfer to PICS. IV fluid bolus of 10-20 mL/kg (maximum 1,000 mL) normal saline. ○ Repeat once as needed to maintain normal BP. If hypotension persists after IV fluids, tocilizumab, and hydrocortisone, start vasopressors, transfer to PICS, obtain ECHO, and refer to further management as in Grade 3 or 4 CRS. Symptomatic management of fever as in Grade 1 CRS. Symptomatic management of constitutional symptoms and organ toxicities as per standard guidelines.</td>
<td>• Administer tocilizumab(^1) for 1 dose after second IV fluid bolus. If possible adrenal insufficiency, consider stress dose hydrocortisone 12.5 – 25 mg/m(^2)/day divided every 6 hours. If hydrocortisone not used, consider methylprednisolone 1 – 2 mg/kg for one dose [or dexamethasone 0.15 - 0.5 mg/kg/dose (maximum 10 mg) IV for 1 dose] and reassess in 6 hours or earlier if clinically indicated. ○ Tocilizumab may be repeated every 8 hours for up to 3 doses in a 24-hour period.</td>
</tr>
<tr>
<td></td>
<td>Hypoxia</td>
<td>• Pulse oximetry. Fever work-up if not previously performed. ○ Assess for infection with blood and urine cultures, and chest radiography.</td>
<td>• Use supplemental oxygen as needed. If hypoxia persists after above interventions, but oxygen requirement is stable with low-flow nasal cannula, continue close monitoring. If oxygen requirement increases to high-flow nasal cannula, face mask, or positive pressure ventilation, refer to further management as in Grade 3 or 4 CRS. Symptomatic management of fever as in Grade 1 CRS. Symptomatic management of constitutional symptoms and organ toxicities as per standard guidelines.</td>
<td>• Administer tocilizumab(^1) for 1 dose and consider methylprednisolone 1 – 2 mg/kg for one dose [or dexamethasone 0.5 mg/kg/dose (maximum 10 mg) IV for 1 dose] and reassess in 6 hours or earlier if clinically indicated. ○ Tocilizumab may be repeated every 8 hours for up to 3 doses in a 24-hour period.</td>
</tr>
</tbody>
</table>

**Notes:**

- **CRS** = Pediatric Intensive Care
- **PICS** = Pediatric Intensive Care
- **\(^2\)Hypotension defined as:**
  - Age 1-10 years: SBP < [70 + (2 x age in years)] mmHg
  - Age > 10 years: SBP < 90 mmHg

## APPENDIX I: Management of ICANS

<table>
<thead>
<tr>
<th>ICANS Grade</th>
<th>Sign or symptom</th>
<th>Diagnostic Work-up</th>
<th>Management</th>
<th>Supportive Care</th>
<th>Anti-IEC Therapies</th>
</tr>
</thead>
</table>
| Grade 1     | Encephalopathy and/or depressed level of consciousness | • MRI imaging of the brain with and without contrast; CT of brain without contrast may be performed if MRI is not feasible; MRI spine if focal deficits are noted  
• Neurology consultation  
• ICE Score and/or CAPD assessment every 6 hours or more frequently if clinically indicated  
• EEG  
• Consider diagnostic lumbar puncture if other causes of encephalopathy are suspected (e.g., infections, autoimmune, leptomeningeal disease) | Vigilant supportive care; aspiration precautions; IV hydration  
• Withhold oral intake of food/medications/fluids and assess swallowing; convert all oral medications and/or nutrition to IV if swallowing is impaired  
• Avoid medications that cause central nervous system depression  
• Low doses of lorazepam after EEG is performed [0.02 mg/kg/dose (maximum 0.5 mg) IV every 8 hours] or haloperidol [0.01 mg/kg/dose (maximum 0.5 mg) IV every 6 hours] may be used with careful monitoring for agitated patients  
• If no seizures on EEG, continue prophylactic levetiracetam  
• If EEG shows focal or generalized convulsive or non-convulsive seizure or convulsive status epilepticus, refer to further management as in Grade 3 or 4 ICANS | If associated with concurrent CRS, add tocilizumab¹  
If no response to tocilizumab or for isolated ICANS, start dexamethasone 0.5 mg/kg/dose (maximum 10 mg) IV for 1 dose (or methylprednisolone equivalent) and reassess in 6 hours or earlier if clinically indicated |
| Grade 2     | Encephalopathy and/or depressed level of consciousness | • Neurological work-up as in Grade 1 ICANS | Supportive care as in Grade 1 ICANS | Dexamethasone 0.5 mg/kg/dose (maximum 10 mg) IV every 12 hours (or methylprednisolone equivalent)  
• If associated with concurrent CRS, add tocilizumab¹  
• Once ICANS improves to Grade 1 or less, taper and/or stop corticosteroids depending on clinical situation |

¹See Appendix J for Dosing of IL-6 Antagonists and Alternative Agents
ICANS Grade | Sign or symptom | Management
--- | --- | ---
Encephalopathy and/or depressed level of consciousness | Neurological work-up as in Grade 1 ICANS | Supportive care as in Grade 1 ICANS
Consider repeat neuro-imaging (CT or MRI) every 2-3 days for persistent > Grade 3 encephalopathy | Dexamethasone 0.5 mg/kg/dose (maximum 10 mg) IV every 6 hours (or methylprednisolone equivalent)
○ If associated with concurrent CRS, add tocilizumab
If Grade 3 encephalopathy is persistent for > 24 hours, increase dexamethasone to 1 mg/kg/dose (maximum 20 mg) IV every 6 hours (or methylprednisolone equivalent)
If associated with concurrent CRS, add tocilizumab
If Grade 3 encephalopathy improves to Grade 1 or less, taper and/or stop corticosteroids depending on clinical situation |
Grade 3 Seizure | Neurological work-up as in Grade 1 ICANS | Transfer to PICS
EEG if clinically indicated (e.g., ongoing seizures, depressed level of consciousness) | Dexamethasone 1 mg/kg/dose (maximum 20 mg) IV every 6 hours (or methylprednisolone equivalent)
○ If associated with concurrent CRS, add tocilizumab
If Grade 3 encephalopathy improves to Grade 1 or less, taper and/or stop corticosteroids depending on clinical situation |
Focal cerebral edema | Neurological work-up as in Grade 1 ICANS | Transfer to PICS
Consider repeat neuro-imaging (CT or MRI) every 24 hours until edema resolves or more frequently if clinically indicated | If focal edema is in brain stem or thalamus, methylprednisolone 30 mg/kg/day (maximum 1,000 mg/day) in divided doses IV for 3 days followed by taper depending on clinical situation
○ If associated with concurrent CRS, add tocilizumab
If focal edema is in other areas of brain, methylprednisolone 30 mg/kg/day (maximum 1,000 mg/day) in divided doses IV for 1 day; assess daily and continue or taper depending on clinical situation
○ If associated with concurrent CRS, add tocilizumab

1 Abnormal findings on imaging where correction of hypertension, uremia, and/or coagulopathy should be performed include changes suggestive of typical or atypical posterior reversible encephalopathy syndrome (PRES), temporal lobe and limbic system encephalitis (autoimmune or infection), acute disseminated encephalomyelitis, emboli, vasculitis, strokes, and/or seizure-related changes

2 See Appendix J for Dosing of IL-6 Antagonists and Alternative Agents

3 See Appendix J for Dosing of IL-6 Antagonists and Alternative Agents

</tr>
<tr>
<td>Safety switches</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>• If the IEC product contains a safety switch (e.g., iCaspase-9 or EGFRt-positive), the corresponding drug to eliminate those cells can be considered in doses according to manufacturer • Examples include rimiducid to eliminate iCaspase-9 or cetuximab to eliminate EGFRt-positive cells</td>
</tr>
</tbody>
</table>

¹ MD Anderson formulary restricted for use in CRS/ICANS and for use in hemophagocytic lymphohistiocytosis (HLH), see Appendix N  
² MD Anderson formulary restricted for use in CRS/ICANS  
³ Not on MD Anderson formulary; use at MD Anderson is based on internal data in patients with tocilizumab and/or siltuximab failure
**APPENDIX L: Management of Convulsive Status Epilepticus**

- Assess CAB / airway protection / high flow O₂, check blood glucose
- Transfer to PICs
- Consult Neurology
- Lorazepam 0.1 mg/kg (maximum 4 mg) IV; repeat dose after at least 1 minute (to a maximum of 2 doses) to control seizures
- Levetiracetam 40 mg/kg (maximum 2,500 mg) IV bolus (in addition to maintenance dose)
- Replete with magnesium as needed to maintain magnesium level > 2 mg/dL
- Thiamine 100 mg IV every 8 hours for 5 days
- If seizures persist, add phenobarbital at a loading dose 10-20 mg/kg (maximum 1,000 mg) IV (monitor for respiratory depression, bradycardia and hypotension)
- Maintenance doses after resolution of non-convulsive status epilepticus
  - Lorazepam 0.05 mg/kg (maximum 1 mg) IV every 8 hours for 3 doses
  - Levetiracetam 15 mg/kg (maximum 1,500 mg) IV every 12 hours
  - Phenobarbital 1-3 mg/kg IV every 12 hours
    - Monitor for respiratory depression, bradycardia and hypotension
    - Assess for drug-drug interactions (i.e., may induce metabolism of azole antifungals or other CYP3A4 substrates) and consider alternative therapy if drug interactions are significant
    - Target serum trough levels 15-40 mcg/mL
- Continuous EEG if seizures are refractory to treatment

**APPENDIX K: Management of Focal or Generalized Convulsive or Non-Convulsive Seizures**

- Assess CAB / consider airway protection / check blood glucose
- Consult Neurology
- For focal and generalized convulsive seizures, lorazepam 0.05 mg/kg (maximum 1 mg) IV; repeat dose every 5 minutes (to a maximum of 4 doses) to control electrographical seizures
- Levetiracetam 40 mg/kg (maximum 2,500 mg) IV bolus (in addition to maintenance dose)
- Replete with magnesium as needed to maintain magnesium level > 2 mg/dL
- Thiamine 100 mg IV every 8 hours for 5 days
- If non-convulsive seizures persist, transfer to PICS and add phenobarbital loading dose of 10-20 mg/kg (maximum 1,000 mg) IV (monitor for respiratory depression, bradycardia and hypotension)
- Maintenance doses after resolution of non-convulsive status epilepticus
  - Lorazepam 0.05 mg/kg (maximum 1 mg) IV every 8 hours for 3 doses
  - Levetiracetam 15 mg/kg (maximum 1,500 mg) IV every 12 hours
  - Phenobarbital 1-3 mg/kg IV every 12 hours
    - Monitor for respiratory depression, bradycardia and hypotension
    - Assess for drug-drug interactions (i.e., may induce metabolism of azole antifungals or other CYP3A4 substrates) and consider alternative therapy if drug interactions are significant
    - Target serum trough levels 15-40 mcg/mL

Disclaimer: This algorithm has been developed for MD Anderson using a multidisciplinary approach considering circumstances particular to MD Anderson’s specific patient population, services and structure, and clinical information. This is not intended to replace the independent medical or professional judgment of physicians or other health care providers in the context of individual clinical circumstances to determine a patient’s care. This algorithm should not be used to treat pregnant women.
APPENDIX M: Management of Diffuse Cerebral Edema and/or Raised Intracranial Pressure

For papilledema without diffuse cerebral edema or other signs of raised intracranial pressure

- Acetazolamide 15 mg/kg (maximum 1,000 mg) IV followed by 8-12 mg/kg (maximum 1,000 mg) IV every 12 hours (monitor renal function and acid/base balance once or twice daily and adjust dose accordingly)
- Dexamethasone 1 mg/kg/dose (maximum 20 mg) IV every 6 hours (or methylprednisolone equivalent) and start taper after resolution of papilledema

For diffuse cerebral edema on neuroimaging or signs of raised intracranial pressure such as decerebrate or decorticate posturing, cranial nerve VI palsy, or Cushing’s triad

- Methylprednisolone 30 mg/kg/day in divided doses IV for 3 days followed by taper as clinically indicated
- Elevate head end of patient’s bed to an angle of 30 degrees
- Hyperventilation to achieve target PaCO₂ of 28-30 mmHg, but maintained for no longer than 24 hours
- Hyperosmolar therapy with either mannitol 20% or hypertonic saline (3% or 23.4% as detailed below)
  - Mannitol: initial dose 0.5-1 g/kg IV; maintenance dose 0.25-1 g/kg IV every 6 hours while monitoring metabolic profile and serum osmolality every 6 hours; and withhold mannitol infusion if serum osmolality is ≥ 320 mOsm/kg or osmolality gap is ≥ 40)
  - Hypertonic 3% saline: initial dose 5 mL/kg IV over 15 minutes, maintenance dose of 1 mL/kg/hour IV to reach a target sodium level of 150-155 mEq/L (monitor electrolytes every 4 hours; hold infusion if serum sodium levels reach > 155 mEq/L)
  - Hypertonic 23.4% saline (for patients with imminent herniation): 0.5 – 1 mL/kg. Dose to be administered by physician; repeat after 15 minutes, if needed
- If patient has ommaya reservoir, drain CSF to target OP < 20 mmHg
- Control hypertension with the goal of maintaining mean arterial pressure (MAP) within 20-25 mmHg of baseline MAP; correct any uremia (dialysis if needed) and/or coagulopathy (transfuse to keep platelets > 20-50 K/microliter, fibrinogen > 200 mg/dL and INR < 1.5)
- Consider neurosurgery consultation and IV anesthetics for burst-suppression pattern on EEG; transfuse to keep platelets ≥ 100 K/microliter if possible and correct coagulopathy in case of surgical intervention
- Consider additional therapies (see Appendix J) including activation of safety switches if applicable
- Metabolic profile every 6 hours and daily CT scans of head without contrast, with adjustments in usage of aforementioned medications to prevent rebound cerebral edema, renal failure, electrolyte abnormalities, hypovolemia and hypotension

OP = opening pressure
APPENDIX N: Diagnostic Criteria for IEC-Related Hemophagocytic Lymphohistiocytosis (HLH) or Macrophage Activation Syndrome (MAS)

- Consider HLH/MAS if a patient has a peak ferritin > 10,000 ng/mL during the CRS phase and develops any two of the following organ toxicities after IEC therapy:
  - ≥ Grade 3 increase in bilirubin, aspartate transaminase, or alanine transaminase
  - ≥ Grade 3 oliguria or increase in creatinine
  - ≥ Grade 3 pulmonary edema
  - Presence of hemophagocytosis by morphology and/or CD68 immunohistochemistry in bone marrow or organs
- If HLH/MAS is suspected, obtain baseline fasting triglyceride level and serum soluble IL-2 receptor

MANAGEMENT OF IEC-ASSOCIATED HLH / MAS

Suspected HLH → Manage ≥ Grade 3 organ toxicity with tocilizumab and corticosteroids, see Appendix H for management of CRS → Monitor ferritin, LDH, fibrinogen, transaminases, bilirubin, creatinine → Improvement after 48 hours?

Yes → Continue management of CRS, see Appendix H

No → Consider adding etoposide (150 mg/m² IV twice weekly for weeks 1-2, then once weekly) → Consider intrathecal cytarabine (30-70 mg based on age)³ with or without intrathecal hydrocortisone (15-50 mg based on age)³ for ICANS

³Intrathecal cytarabine
- 1–1.99 years: 30 mg
- 2–2.99 years: 50 mg
- At least 3 years old: 70 mg

³Intrathecal hydrocortisone
- 1–1.99 years: 15 mg
- 2–2.99 years: 25 mg
- At least 3 years old: 50 mg

Disclaimer: This algorithm has been developed for MD Anderson using a multidisciplinary approach considering circumstances particular to MD Anderson’s specific patient population, services and structure, and clinical information. This is not intended to replace the independent medical or professional judgment of physicians or other health care providers in the context of individual clinical circumstances to determine a patient’s care. This algorithm should not be used to treat pregnant women.
APPENDIX O: Determine if the Subject Has Allogeneic IEC-associated Acute Graft-Versus-Host Disease (GVHD)

If a subject has any of the following symptoms or signs within the first 3 months after allogeneic IEC therapy, the subject may have acute GVHD if the symptoms or signs are not attributable to any other cause.

1. Skin rash
2. Diarrhea (may also be associated with nausea, vomiting, and/or anorexia due to upper GI GVHD)¹
3. Total bilirubin ≥ 2 mg/dL

¹ Isolated upper GI GVHD with nausea, vomiting, and/or anorexia is uncommon following allogeneic lymphocyte infusion

APPENDIX P: Determine the Grade of IEC-associated Acute GVHD

GVHD Target Organ Staging

<table>
<thead>
<tr>
<th>Stage</th>
<th>Skin</th>
<th>Liver (bilirubin)</th>
<th>Lower GI (stool output/day)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>No active (erythematous) GVHD rash</td>
<td>&lt; 2 mg/dL</td>
<td>&lt; 10 mL/kg/day or &lt; 4 episodes/day</td>
</tr>
<tr>
<td>1</td>
<td>Maculopapular rash &lt; 25% BSA</td>
<td>2 - 3 mg/dL</td>
<td>10-19.9 mL/kg/day or 4-6 episodes/day</td>
</tr>
<tr>
<td>2</td>
<td>Maculopapular rash 25 – 50% BSA</td>
<td>3.1 - 6 mg/dL</td>
<td>20-30 mL/kg/day or 7-10 episodes/day</td>
</tr>
<tr>
<td>3</td>
<td>Maculopapular rash &gt; 50% BSA</td>
<td>6.1 - 15 mg/dL</td>
<td>&gt; 30 mL/kg/day or &gt; 10 episodes/day</td>
</tr>
<tr>
<td>4</td>
<td>Generalized erythroderma (&gt; 50% BSA) plus bullous formation and desquamation &gt; 5% BSA</td>
<td>&gt; 15 mg/dL</td>
<td>Severe abdominal pain with or without ileus or grossly bloody stool (regardless of stool volume)</td>
</tr>
</tbody>
</table>

Overall Clinical Grade (based on most severe organ involvement)

<table>
<thead>
<tr>
<th>Grade</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>No stage 1-4 of any organ</td>
</tr>
<tr>
<td>I</td>
<td>Stage 1-2 skin without liver, upper GI², or lower GI involvement</td>
</tr>
<tr>
<td>II</td>
<td>Stage 3 rash and/or stage 1 liver and/or stage 1 upper GI² and/or stage 1 lower GI</td>
</tr>
<tr>
<td>III</td>
<td>Stage 2-3 liver and/or stage 2-3 lower GI, with stage 0-3 skin and/or stage 0-1 upper GI²</td>
</tr>
<tr>
<td>IV</td>
<td>Stage 4 skin, liver, or lower GI involvement, with stage 0-1 upper GI²</td>
</tr>
</tbody>
</table>

BSA = body surface area

² Isolated upper GI GVHD with nausea, vomiting, and/or anorexia is uncommon following allogeneic lymphocyte infusion
### APPENDIX Q: Manage IEC-associated Acute GVHD

<table>
<thead>
<tr>
<th>Grade</th>
<th>Sign or Symptom</th>
<th>Management</th>
</tr>
</thead>
<tbody>
<tr>
<td>Grade I</td>
<td>Skin rash</td>
<td>- Skin biopsy, preferably non-sun exposed site</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Hydrocortisone cream 1% twice daily to face</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Triamcinolone cream 0.1% three times daily to affected body area</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- If patient fails triamcinolone, may consider clobetasol cream 0.05% twice daily to body; limit use to no longer than 1-2 weeks</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- All corticosteroid creams should be followed by an emollient such as CeraVe, Aquaphor or Eucerin (creams not lotions) 20-40 minutes after application of corticosteroid</td>
</tr>
<tr>
<td>Grade II-IV</td>
<td>Skin rash &gt; 50% BSA and/or</td>
<td>- Skin biopsy as above for rash</td>
</tr>
<tr>
<td></td>
<td>Total bilirubin &gt; 2 mg/dL and/or</td>
<td>- Gastrointestinal consult for flexible sigmoidoscopy with or without upper GI endoscopy with duodenal biopsy&lt;sup&gt;1&lt;/sup&gt;</td>
</tr>
<tr>
<td></td>
<td>Diarrhea &gt; 10 mL/kg/day</td>
<td>- DO NOT give GI prep (GoLytely, etc.) unless full colonoscopy ordered</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Stool culture for <em>C. difficile</em> and GI multiplex panel</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- DO NOT wait for completion of these procedures to start systemic therapy</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Start prednisone 2 mg/kg/day orally or methylprednisolone equivalent in divided doses</td>
</tr>
</tbody>
</table>

BSA = body surface area

<sup>1</sup> Upper GI endoscopy may be considered if patient has nausea, vomiting, and/or anorexia and upper GI GVHD is suspected
SUGGESTED READINGS

This practice consensus statement is based on majority opinion of the Pediatric IEC Therapy Toxicity Assessment and Management experts at the University of Texas MD Anderson Cancer Center for the patient population. These experts included:

- Linette J. Ewing, MD (Pediatrics – Patient Care)
- Alison Gulbis, PharmD (Pharmacy Clinical Programs)
- Sajad Khazal, MD (Pediatrics – Patient Care)
- Kris M. Mahadeo, MD (Pediatrics – Patient Care)
- Rodrigo Mejia, MD (Pediatrics – Patient Care)
- Maria Estela Mireles, PharmD (Pharmacy Clinical Programs)
- Christina Perez
- Demetrios Petropoulos, MD (Pediatrics – Patient Care)
- Shehla Razvi, MD (Pediatrics – Patient Care)
- Basirat Shoberu, PharmD (Pediatrics – Patient Care)
- Elizabeth Shpall, MD (Stem Cell Transplantation)
- John Slopis, MD (Neuro-Oncology)
- Milena Zhang, PharmD
