PT = physical therapy
**INITIAL ASSESSMENT**

1. Refer to Assessment of Current Activity Level in Appendix A
2. In addition perform nutrition assessment based on the Nutrition - Adult algorithm
3. American College of Sports Medicine (ACSM) Guideline for patients undergoing cancer treatment includes:
   - Weekly activity of at least 90 minutes (30 minutes per session) of moderate-intensity activity
   - Two weekly sessions of strength training that include major muscle groups (2 sets of 12-15 repetitions for each exercise)
4. American College of Sports Medicine (ACSM) Guideline for patients not undergoing cancer treatment includes:
   - Weekly activity of at least 150 minutes of moderate-intensity activity or 75 minutes of vigorous-intensity activity or equivalent combination
   - Two or more weekly sessions of strength training that include major muscle groups
5. Refer to Conditions that Require Medical Clearance in Appendix B and Conditions that Require PT Supervised Activity in Appendix C
6. See Appendix D for Physical Activity Clearance form. See Forms on Demand at http://onbasefod/
7. If clearance form has not been received within 4 weeks, follow-up with patient as needed and/or reassess upon return to clinic
8. Adjust exercise prescription as needed if health status and/or exercise tolerance change, see Appendix A
9. Refer to Progression of Levels of Activity in Appendix A
10. If MI is not conducted, encourage and counsel patient on importance of meeting ACSM guidelines

---

**ACSM = American College of Sports Medicine**

Department of Clinical Effectiveness V4
Approved by the Executive Committee of the Medical Staff on 03/23/2021
INITIAL ASSESSMENT - continued

Patient cleared for unsupervised exercise

- Review ACSM guidelines\(^1,2\) with the patient
- Refer to Exercise Physiology Technologist (EPT)/ community exercise program/independent exercise program provider for exercise prescription\(^3,4\)

Patient referred to PT for assessment

Patient requires PT for supervised PA\(^3\)

- Re-evaluate upon return to clinic
- Provide positive reinforcement

Patient not cleared for supervised or unsupervised PA

- Re-evaluate upon return to clinic
- Provide positive reinforcement

Patient cleared for unsupervised PA

Physical Activity Clearance form completed by appropriate provider

Patient cleared for unsupervised exercise

- Review ACSM guidelines\(^1,2\) with the patient
- Refer to Exercise Physiology Technologist (EPT)/ community exercise program/independent exercise program provider for exercise prescription\(^3,4\)

\(^1\) American College of Sports Medicine (ACSM) Guideline for patients undergoing cancer treatment includes:
- Weekly activity of at least 90 minutes (30 minutes per session) of moderate-intensity activity
- Two weekly sessions of strength training that include major muscle groups (2 sets of 12-15 repetitions for each exercise)

\(^2\) American College of Sports Medicine (ACSM) Guideline for patients not undergoing cancer treatment includes:
- Weekly activity of at least 150 minutes of moderate-intensity activity or 75 minutes of vigorous-intensity activity or equivalent combination
- Two or more weekly sessions of strength training that include major muscle groups

\(^3\) Adjust exercise prescription as needed if health status and/or exercise tolerance change, see Appendix A

\(^4\) Refer to Progression of Levels of Activity in Appendix A

\(^5\) See Appendix C Conditions that Require PT Supervised Activity
APPENDIX A: Activity/Exercise Prescriptions

Inactivity is detrimental to health; therefore regular physical activity should be promoted for reduction of cancer risk\(^1\) as well as other chronic diseases. If the ACSM Physical Activity guidelines\(^2,3,4\) are unable to be met then recommend any form of activity beyond activities of daily living (ADL), even if the only opportunity is to replace sitting with standing.

Assessment of Current Activity Level

Begin with an understanding of the patient’s current level of activity

<table>
<thead>
<tr>
<th>Level of Activity</th>
<th>Low</th>
<th>Moderate(^2,3,4) (meeting ACSM Guidelines)</th>
<th>High(^2,3,4) (meeting ACSM Guidelines)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Aerobic</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Frequency (F)</td>
<td>1-5 days/week</td>
<td>F: 1-2 days/week</td>
<td>F: 2-4 days/week</td>
</tr>
<tr>
<td>Intensity (I)</td>
<td>1-6 RPE(^5)</td>
<td>I: 1-2 sets of 6-10 repetitions</td>
<td>I: 2-3 sets of 10-15 repetitions</td>
</tr>
<tr>
<td>Duration (D)</td>
<td>&lt; 90 minutes/week</td>
<td>D: 4-8 different exercises</td>
<td>D: 8-10 different exercises</td>
</tr>
<tr>
<td>Type (T)</td>
<td>Patient preferred, enjoyable, realistic activity</td>
<td>T: Rest: 2-3 minutes between sets; 48 hours between workouts consisting of same muscle groups</td>
<td>T: Rest: 2-3 minutes between sets; 48 hours between workouts consisting of same muscle groups</td>
</tr>
</tbody>
</table>

Progression of Levels of Activity

The goal of exercise progression is to move from current level of activity to the next level of activity. Consider variation or additional activity when progressing. Progression should occur by adding increments of time to the F or D, then increasing I (e.g., incline, resistance, etc.), and/or T change of activity (e.g., walking to jogging). Adjust exercise prescription as needed if health status and/or exercise tolerance changes\(^6\).

Level of Activity

- **Low**
  - Frequency (F): 1-5 days/week
  - Intensity (I): 1-6 RPE\(^5\)
  - Duration (D): < 90 minutes/week
  - Type (T): Patient preferred, enjoyable, realistic activity

- **Moderate\(^2,3,4\)** (meeting ACSM Guidelines)
  - Frequency (F): 3-5 days/week
  - Intensity (I): 5-8 RPE\(^3\)
  - Duration (D): 90 - 150 minutes/week
  - Type (T): Patient preferred, enjoyable, realistic activity

- **High\(^2,3,4\)** (meeting ACSM Guidelines)
  - Frequency (F): 5-7 days/week
  - Intensity (I): 7-8 RPE\(^5\) continuous exercise and/or a combination of 9-10 RPE\(^3\) intervals
  - Duration (D): >150 minutes/week
  - Type (T): Patient preferred, enjoyable, realistic activity

Resistance (large muscle groups)

- **Low**
  - Frequency (F): 1-2 days/week
  - Intensity (I): 1-2 sets of 6-10 repetitions
  - Duration (D): 4-8 different exercises
  - Type (T): Rest: 2-3 minutes between sets; 48 hours between workouts consisting of same muscle groups

- **Moderate\(^2,3,4\)** (meeting ACSM Guidelines)
  - Frequency (F): 2-4 days/week
  - Intensity (I): 2-3 sets of 10-15 repetitions
  - Duration (D): 8-10 different exercises
  - Type (T): Rest: 2-3 minutes between sets; 48 hours between workouts consisting of same muscle groups

- **High\(^2,3,4\)** (meeting ACSM Guidelines)
  - Frequency (F): 2-4 days/week
  - Intensity (I): 2-3 sets of 10-15 repetitions
  - Duration (D): 8-10 different exercises
  - Type (T): Rest: 2-3 minutes between sets; 48 hours between workouts consisting of same muscle groups

Comments

Regardless of physical activity level, sedentary behavior is still detrimental to health. Therefore, it is recommended that sedentary time be limited and preferably replaced with any movement and/or standing when possible.

1 Refer to Appendix F for Tips to Get Fit
2 American College of Sports Medicine (ACSM) Guideline for patients undergoing cancer treatment includes:
   - Weekly activity of at least 90 minutes (30 minutes per session) of moderate-intensity activity
   - Two weekly sessions of strength training that include major muscle groups (2 sets of 12-15 repetitions for each exercise)
3 American College of Sports Medicine (ACSM) Guideline for patients not undergoing cancer treatment includes:
   - Weekly activity of at least 150 minutes of moderate-intensity activity or 75 minutes of vigorous-intensity activity or equivalent combination
   - Two or more weekly sessions of strength training that include major muscle groups
4 If meeting guideline, provide positive reinforcement, encouragement to maintain activity level, and continued reinforcement of guideline recommendations at follow-up visit
5 See Page 5 for Rate of Perceived Exertion (RPE) Scale
6 See Page 5 for Changes in Exercise Tolerance

1 Refer to Appendix F for Rate of Perceived Exertion (RPE) Scale
2 American College of Sports Medicine (ACSM) Guideline for patients undergoing cancer treatment includes:
   - Weekly activity of at least 90 minutes (30 minutes per session) of moderate-intensity activity
   - Two weekly sessions of strength training that include major muscle groups (2 sets of 12-15 repetitions for each exercise)
3 American College of Sports Medicine (ACSM) Guideline for patients not undergoing cancer treatment includes:
   - Weekly activity of at least 150 minutes of moderate-intensity activity or 75 minutes of vigorous-intensity activity or equivalent combination
   - Two or more weekly sessions of strength training that include major muscle groups
4 If meeting guideline, provide positive reinforcement, encouragement to maintain activity level, and continued reinforcement of guideline recommendations at follow-up visit
5 See Page 5 for Rate of Perceived Exertion (RPE) Scale

Continued on next page
Rate of Perceived Exertion (RPE) Scale

The rate of perceived exertion (RPE) scale is a tool used to subjectively measure one’s own exercise intensity. The RPE scale runs from 0 – 10. The numbers on the scale rate how easy or how difficult it is to complete aerobic and resistance activities. For example, an individual might rate their perceived exertion as zero (nothing at all) while sitting in a chair and a ten (very, very heavy) after completing a stress test. The scale can be used to appropriately adjust the exercise intensity as needed.

APPENDIX A: Activity/Exercise Prescriptions - continued

Changes in Exercise Tolerance

If exercise elicits symptoms of intolerance, as listed below, then adjust FIDT to reduce/alleviate symptoms without promoting sedentary activity. If symptoms of intolerance persist, reduce activity level and seek Physical Activity Clearance (see Appendices B and C).

- **Performance**
  - Decreased performance (strength, power output, muscle endurance, cardiovascular endurance)
  - Increased recovery requirements
  - Decreased motor coordination

- **Physiology**
  - New onset of symptoms of cardiovascular and/or pulmonary disease, metabolic disease, or renal disease
  - Unexplained change in resting heart rate, blood pressure, and respiration patterns
  - Increased HR during submaximal work
  - Chronic fatigue
  - Sleep and eating disorders
  - Menstrual disruptions
  - Headaches, gastrointestinal distress
  - Chronic or extreme muscle soreness or injury
  - New or increased joint aches and pains

- **Psychological**
  - New onset of symptoms of depression and apathy, decreased self-esteem, decreased concentration in response to exercise

- **Immunology**
  - Increased occurrence of illness
  - Decreased rate of healing
  - Impaired immune function (neutrophils, lymphocytes, mitogen responses, eosinophils)

FIDT = Frequency (F); Intensity (I); Duration (D); Type (T)
APPENDIX B: Conditions that Require Medical Clearance

If the patient reports any of the following, provide the patient with Physical Activity Clearance form to be competed by appropriate provider.

**Cardiovascular disease (CVD) or pulmonary disease may include:**
- Chest discomfort centered under the breastbone and/or slightly to the left characterized by a sensation of heavy pressure, squeezing, or fullness (note: not all CVD causes chest discomfort)
- Pain that begins in the chest and spreads to the shoulders, between the shoulder blades, arms, elbows, back, neck, jaw or abdomen
- Rapid or irregular pulse accompanied by dizziness and shortness of breath
- Feeling short of breath at rest or with minimal exertion
- Dizziness, lightheadedness, or loss of consciousness
- Unusual and excessive fatigue often accompanied by nausea and/or lack of appetite
- Extreme or unexplained weakness
- Profuse sweating with no physical exertion
- Swelling (accumulation of fluid) especially in the feet, ankles, legs, or abdomen
- Intermittent claudication
- Persistent cough, bloody cough or wheezing
- Intense anxiety; sense of impending doom

**Renal disease:**
- Nausea and vomiting
- Passing only small amounts of urine
- Swelling, particularly of the ankles, and puffiness around the eyes
- Unpleasant taste in the mouth and urine-like odor to the breath
- Persistent fatigue or shortness of breath
- Loss of appetite
- Increasingly higher blood pressure
- Muscle cramps, especially in the legs
- Pale skin
- Excessively dry, itchy skin

**Metabolic disease:**
- Uncontrolled diabetes (signs and symptoms can include increased thirst and urination, blurred vision, numbness/tingling in the feet, non-healing wounds, fruity smell to the breath)

APPENDIX C: Conditions that Require Supervised Activity

- Recent decrease in physical abilities, including falling or needing to move with assistance such as a walker, cane or wheelchair
- Low or unstable platelet counts, within the past month
- Bone, joint or soft tissue problems and/or injury in the last month that are made worse by increased physical activity
- Post-surgical activity restrictions or side effects that limit physical activity
- Presence of acute and/or long-term side effects from cancer or cancer treatments that limit activities of daily living (ADL) or ability to exercise
- Unmanaged lymphedema
- Limitations identified by appropriate provider

Disclaimer: This algorithm has been developed for MD Anderson using a multidisciplinary approach considering circumstances particular to MD Anderson’s specific patient population, services and structure, and clinical information. This is not intended to replace the independent medical or professional judgment of physicians or other health care providers in the context of individual clinical circumstances to determine a patient’s care. This algorithm should not be used to treat pregnant women.

APPENDIX D: Physical Activity Clearance Form

**SAMPLE**

Primary Care Provider

Physical Activity Clearance

The following is to be completed by the treating Primary Care Provider ("Provider").

Based on a current health status review, , hereby give medical clearance for to participate in physical activity at the following level:

- Progress as tolerated without limitations
- Progress as tolerated with limitations

Specify Limitations:

- Consider referring to PT/OT for assessment of physical limitations or supervised activity

*Consider referral to PT/OT if the patient has:

- Recent decrease in physical abilities, including falling or needing to move with assistance such as a walker, cane or wheelchair
- Low or unstable platelet counts, within the past month
- Bone, joint or soft tissue problems and/or injury in the last month that are made worse by increased physical activity
- Post-surgical activity restrictions or side effects that limit physical activity
- Presence of acute and/or long-term side effects from cancer, cancer treatments, or any other chronic disease that limit day to day activity or ability to exercise
- Unmanaged Lymphedema
- Provider restrictions

If applicable, Participant will be re-evaluated on (date)

Physical Activity - Adult

APPENDIX E: Benefits of Physical Activity in Cancer Risk Reduction

- Physical activity helps your body work better and reduces your chance of getting certain diseases, including some cancers.
- Research suggests that physical activity may lower your chance of getting the following cancers:
  - Colon
  - Breast
  - Endometrial
- Even if your physical activity does not result in weight loss, just moving your body can lower your chance of getting cancer.
- Physical activity can however, help you lose fat and maintain a healthy weight. Extra body fat has been shown to increase your chance of getting the following cancers:
  - Esophageal
  - Breast (postmenopausal)
  - Pancreatic
  - Colon
  - Endometrial
  - Kidney
  - Rectal
- Physical activity can help lower stress, increase energy levels and boost your immune system.
- Physical activity can reduce your chance of having other health problems. Examples are:
  - Heart disease
  - High blood pressure
  - Diabetes

APPENDIX F: Tips To Get Fit

- Staying active can help you maintain a healthy weight and lower your risk for cancer and other diseases. Build up your activity level and lower your cancer risk. Being inactive can increase your risk for colon, postmenopausal breast and endometrial cancers. It also may increase your chances for lung or pancreatic cancers.

**Sit Less**

- Sitting too much may cause you to gain body fat.

  **How to Start:**
  - Get up and move for a minute or two every hour while you’re awake.

**Boost Your Heart Rate**

- Do 150 minutes of moderate activity each week. Moderate activities, like brisk walking, dancing or gardening speed up your heart and make you feel a little out of breath.

  **or**

- Do 75 minutes of vigorous activity each week. Running, playing basketball or swimming laps are vigorous, and make you breathe harder so it’s hard to speak.

  **How to Start:**
  - Take a brisk walk for 30 minutes, five times a week.
  - Swim laps for 25 minutes, three times a week.

**Get Strong**

- Do muscle strengthening exercises at least twice a week to maintain a healthy weight. Strength training can include exercises with free weights, weight machines, resistance bands or your own body weight.

  **How to Start:**
  - Choose from squats, lunges, leg raises, push-ups, bicep curls, tricep dips and planks.
  - Always rest your muscles for 48 hours after strength training.

DEVELOPMENT CREDITS

This screening algorithm is based on majority expert opinion of the Physical Activity work group at the University of Texas MD Anderson Cancer Center. It was developed using a multidisciplinary approach that included input from the following:

Karen M. Basen-Engquist, PhD (Behavioral Science)
Therese Bevers, MD, FAAFP (Cancer Prevention)*
Olga N. Fleckenstein*
Susan Gilchrist, MD (Clinical Cancer Prevention)
Katherine Gilmore, MPH (Cancer Survivorship)
Alexandra Hacker, MSN, APRN, FNP-BC*
Carol Harrison, MED, CCEP, CET (Behavioral Science)
Ernest Hawk, MD, MPH (Cancer Prevention)
Susan Lilly, SCD, BS, PT (Rehab/Physical Therapy)
Wenli Liu, MD (Integrative Medicine Program)
Gabriel Lopez, MD (Integrative Medicine Program)
Ana C. Nelson, FNP, RN (Cancer Prevention)
Whittney Thoman, MS, ACSM-CEP, ACSM-CET (Integrative Health Services)*
Mary Lou Warren, DNP, RN, CNS-CC*

* Development Lead
* Clinical Effectiveness Development Team
