Colon Polyps

The colon, also called the large intestine, is part of the body’s digestive system. This system absorbs nutrients from food and stores waste until it passes out of the body. A colon polyp is a growth on the inside lining of the colon. Polyps are commonly found in adults. Most are harmless. They can be removed to prevent colorectal cancer.

Polyp Shapes

- Pedunculated polyps are raised on stems, like mushrooms (Figure 1).
- Sessile polyps grow on the surface of the colon, like a mushroom without a stalk (Figure 2).
- Flat lesions grow flat, like a pancake (Figure 3).

Polyp Types

1. **Hyperplastic Polyps**: These, in general, are not cancer. They are usually small and found in the end of the colon, the rectum. Your doctor may want to remove these polyps for a closer look. Having a bigger hyperplastic polyp or having many of them may increase your risk for colon cancer.

2. **Adenomatous Polyps (Precancerous)**: These polyps are not cancer. They may become cancer if they are not removed. They are confined to the inner lining of the colon. There are two kinds of adenomatous polyps.

   - Tubular adenomas are the most common type of polyps. Patients with tubular adenomas need to be screened more often for colorectal cancer.
   - Villous adenomas are the most serious polyp. They have the highest risk of becoming cancer as they grow larger. Patients with these polyps need to be screened more often for colorectal cancer.

Precancerous polyps may also be described by the type of cells they contain. Dysplasia describes polyps with abnormal cells. Depending on how close the cells are to becoming cancer, they may be classified as low or high grade dysplasia.
3. **Cancer:** A polyp described as malignant is cancer.

**Other Non-Cancerous Pathology Results**
You may see other terms in your report. The following are not cancerous. They do not require follow-up.

- Inflammatory polyp
- Colonic or colorectal mucosa
- Lipoma
- Lymphoid aggregate

**Knowing your polyp history**

Your health care provider will need to know about any polyps found. This helps determine when you should have your next colonoscopy. Give your health care provider a copy of the colonoscopy and pathology reports. The colonoscopy report gives the number, size and location of polyps. The pathology report tells about the type of polyps. If you do not have these reports, ask your doctor who ordered or performed your last colonoscopy for the reports. The results of the report and the quality of the colon prep, before the exam, determine when you have your next screening colonoscopy.

MD Anderson recommends your next screening colonoscopy be done in:

- **5 years if:**
  - You had 1 or 2 tubular adenomas that were less than 1 centimeter (cm) in size
- **3 years if:**
  - You had more than 3 tubular adenomas that were removed completely
  - You had 1 adenoma that was larger than 1 cm that was removed completely
- **Less than 3 years if:**
  - You had more than 10 tubular adenomas
  - You had a villous adenoma
  - You had high grade dysplasia
- **2 to 6 months if:**
  - You had a sessile adenoma removed in pieces
