Neutropenia

A neutrophil is a type of white blood cell found in the bloodstream that helps your body fight infection. Neutropenia means the numbers of neutrophils in the bloodstream are below normal. If this happens, you will be at high risk for getting an infection.

Think of the neutrophil as a bodyguard. When you have fewer bodyguards around to protect you, you can get sick easily because your defenses are reduced.

Chemotherapy is one of the most common causes of neutropenia since it prevents the production of neutrophils.

Infection

It is important to know when your neutrophil count is low. You should take your temperature regularly, about three to four times daily.

If you have a temperature of 101°F (38.3°C) or greater, contact your doctor immediately or go to the nearest emergency center. Do not take any medicines to lower your temperature unless directed by your doctor. This may hide a worsening infection.

Possible signs of infection

If you have the following signs and symptoms, then you may have an infection:

- Fever of 100.4°F (38°C) for more than one hour
- Chills – with or without fever
- Body aches
- Extreme fatigue (tiredness)
- Sore throat or mouth sores
- Runny nose
- New or worsening cough
- Shortness of breath
- Redness, swelling or tenderness in any area including around your catheter site
- Diarrhea
- Vomiting
- Burning or pain with urination
- Unusual vaginal discharge or irritation
- Pain in the abdomen or rectum
- Stiff neck
- Changes in mental status
Protect yourself

Follow these instructions to help protect yourself from infection. You may already do most of these, but they are especially important if you are receiving chemotherapy or radiation therapy, or if your doctor thinks you may have neutropenia.

Keep clean
- Wash your hands often. Especially before eating, after using the restroom and after touching doorknobs and handrails.
- Shower daily with lukewarm water.
- Clean your teeth and gums using a soft toothbrush.

Protect your skin
- Never walk barefoot.
- Moisturize dry skin with creams, lotions or oils.
- Wear gloves when washing dishes or cleaning with chemicals.
- Cover any scrapes with a bandage.
- Use an electric shaver, not a razor.
- Limit sun exposure.

Watch your diet
- Clean and cook all foods completely.
- Avoid eating raw fruits and vegetables. (Produce from a can or jar is usually safe since it has been processed.)
- Drink six to eight glasses of fluids each day to help avoid constipation.

What to avoid
Please avoid the following people, places or activities to reduce your risk of infection:
- Large crowds (Do not go to concerts, movie theaters, sporting events or shopping malls.)
- Anyone with signs of an infection, such as fever, cough or runny nose
- People with shingles or chicken pox
- Gardening
- Pet litter boxes and pet waste
- Use a hospital mask to prevent exposure to airborne germs that cause respiratory infection
